

Exercise 6

- Create a new project
 - You can make a copy of your current **Calendar** project simply by using “copy-paste” on the project **pop menu**.
 - Now make a copy of the project and name it anything you want.
- Normal version control operations
 - Check the new project into the **GitHub** or either source version control tool
 - Now (suppose) you accidentally delete any class and try to recover it
- Versioning
 - Tag the project as “**version 1**”.
 - Type some random text into any classes and create some error.
 - Roll back to “**version 1**” without using “**undo**” of the editor
